This document is of a commercial nature and the characteristics reflected are not binding for specific projects. The characteristics of the product will be specified in the final documentation of each project.

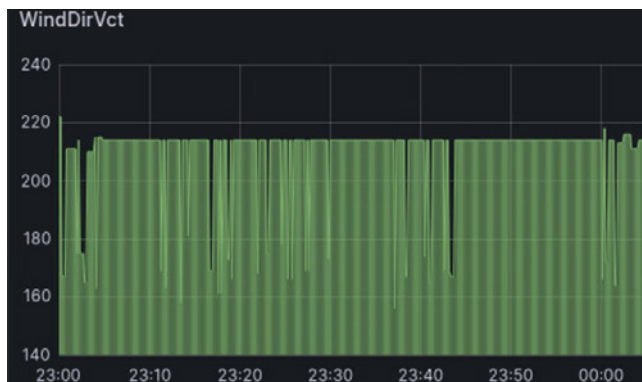

DATA OVERVIEW SUITE

The Data Overview Suite provides our clients with a system for visualizing and monitoring the status of trackers, allowing them to review the historical data of the tracker's main parameters.

The system is based on the open-source Grafana platform, which has been integrated into Soltec's Full Wireless system to offer an additional platform for plant SCADA systems.

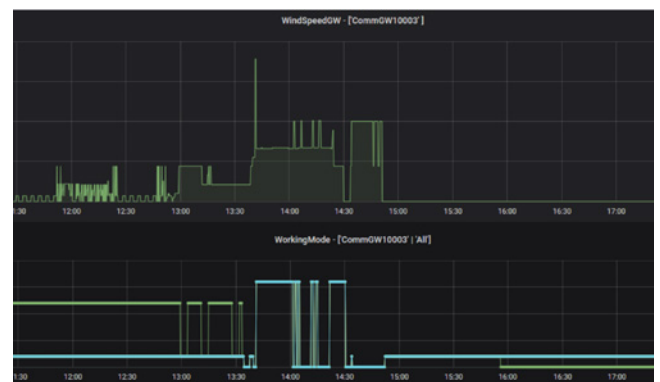

Visual

The data is presented in a bar chart or line graph format. This format is visual and easy for the operator to interpret.

Easy to configure

The operator can select the elements they want to display; a single tracker or an entire subfield can be selected for the different tracker variables.

Agile

In just a few seconds, the system is able to display the records for the entire period selected by the operator, handling datasets of millions of points without loss of performance.

Powerful

It allows exporting and comparing system logs with those acquired from the plant's SCADA system, providing the client with a reliable data source acquired directly from the tracker's control system.
